Explanation: If a pendulum clock is running too slow, the period of its pendulum must be too long. The period is mostly determined by the length of the pendulum. The period increases as the pendulum gets longer, and decreases as it gets shorter. Therefore, making the pendulum shorter will speed up the clock.

Perform experiments with a pendulum to gain an understanding of energy conservation in simple harmonic motion. The mass, length, and gravitational acceleration of the pendulum can be adjusted, as well as the initial angle. The potential energy, kinetic energy, and total energy of the oscillating pendulum can be displayed on a table, bar chart or graph.

The time it takes for one complete down and up motion is called the period of the spring. With the Period of Mass on a Spring Gizmo™, you will measure the effects of three variables on the period of a spring: mass (m), the spring constant (k), and gravitational acceleration (g). First, practice measuring the period. 1.

The period of swing of a pendulum depends primarily on its length, and the acceleration of gravity. It is independent of the mass of the bob. The reason for this is that the period depends on the maximum velocity at the lowest point (where KE is the greatest), and in turn the maximum velocity depends only on the height at the highest point.
